PROBLEM STATEMENT: -

To modify the Linux scheduler to implement a new scheduling class, called background scheduling. We will evaluate how our new scheduling class performs.

KERNEL 2.6: -

- Each CPU in this kernel has a runqueue made up of 140 priority lists that are serviced in FIFO order. Tasks that are scheduled to execute are added to the end of their respective runqueue's priority list.
- Each task has a time slice that determines how much time it's permitted to execute.
- The first 100 priority lists of the runqueue are reserved for real-time tasks, and the last 40 are used for user tasks (MAX_RT_PRIO=100 and MAX_PRIO=140).
- In addition to the CPU's runqueue, which is called the active runqueue, there's also an expired runqueue.
- When a task on the active runqueue uses all of its time slice, it's moved to the expired runqueue. During the move, its time slice is recalculated (and so is its priority).
- If no tasks exist on the active runqueue for a given priority, the pointers for the active and expired runqueues are swapped, thus making the expired priority list the active one.

Kernel 2.6 Scheduler Policies:

- **SCHED_NORMAL** - A conventional, time-shared process (used to be called SCHED_OTHER), for normal tasks.
 1. Each task assigned a "Nice" value
 2. $PRIO = MAX_RT_PRIO + NICE + 20$
 3. Assigned a time slice
 4. Tasks at the same PRIO(rity) are round-robin.
 5. Ensures Priority + Fairness
- **SCHED_FIFO** - A First-In, First-Out real-time process
 1. Run until they relinquish the CPU voluntarily
 2. Priority levels maintained
 3. Not pre-empted!!
- **SCHED_RR** - A Round Robin real-time process
 1. Assigned a timeslice and run till the timeslice is exhausted.
 2. Once all RR tasks of a given PRIO(rity) level exhaust their timeslices, their timeslices are refilled and they continue running
 3. PRIO(rity) levels are maintained
- **SCHED_BATCH** - for "batch" style execution of processes
 1. For computing-intensive tasks
 2. Timeslices are long and processes are round robin scheduled
 3. lowest priority tasks are batch-processed (nice +19)
- **SCHED_IDLE** - for running very low priority background job
 1. nice value has no influence for this policy
 2. extremely low priority (lower than +19 nice)

HOW TO PROCEED:

- We need to add a new scheduling policy called `SCHED_BACKGROUND`. This policy is designed to support processes that only need to run when the system has no other process to do.
- When there are no processes which are managed by the `SCHED_OTHER`, `SCHED_RR` or `SCHED_FIFO` classes, our `SCHED_BACKGROUND` policy will run the background processes.
- When there is more than one `SCHED_BACKGROUND` process ready to run, they should compete for the CPU as do `SCHED_OTHER` processes using CFS i.e., 'Complete Fair Scheduling'.
- We found out that in the latest version of the linux Ubuntu 18.04 having kernel version 4.15, the `sched.c` file is not present, instead a `sched` directory which is consist of many different parts old scheduler. As it was somewhat difficult to modify those many parts due to higher level of encapsulation and also the `sched.c` file exists below kernel version 3.0, we switched to the Ubuntu version 8.04 with kernel version 2.6.24.
- We have to make the changes in the `sched.c` and the `sched.h` files which are responsible for handling scheduler function in kernel. We also need to modify an auxiliary file `chrt.c` in the kernel source which handles all the system calls to kernel-scheduler.
- In linux-2.6.24 there is already a policy named `SCHED_IDLE` which already handles background task.
- We will implement a new policy `SCHED_BACKGROUND` to handle background tasks with lower priority than `SCHED_IDLE`. This will handle tasks only if queues of all other policies are empty.
- We define this new policy in `sched.h` and make required changes in `sched.c`. To support making system calls from terminal, we also add this policy in `chrt.c`, generate its object file and replace it with the default system file.
- We can also use the `sched_setscheduler` method which assigns a particular policy to a process instead of updating the `chrt.c` file.

STEPS: - First we need to install Ubuntu kernel version 2.6.24

Press F4 to enter the graphical mode otherwise you have to completely use the CLI.

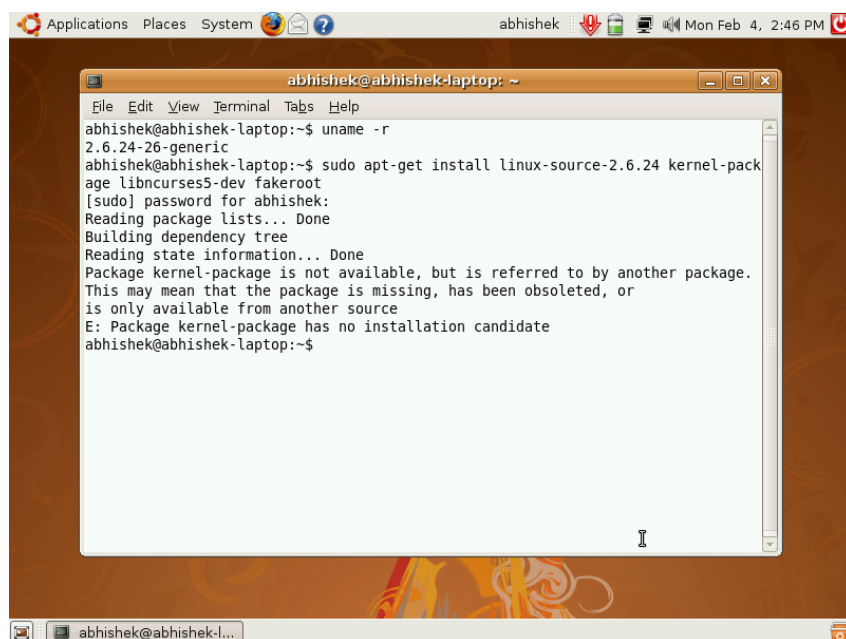

- First, we have to confirm that our kernel version is correct. So, we use the following command:

```
$ uname -r
```

```
2.6.24-26-generic
```

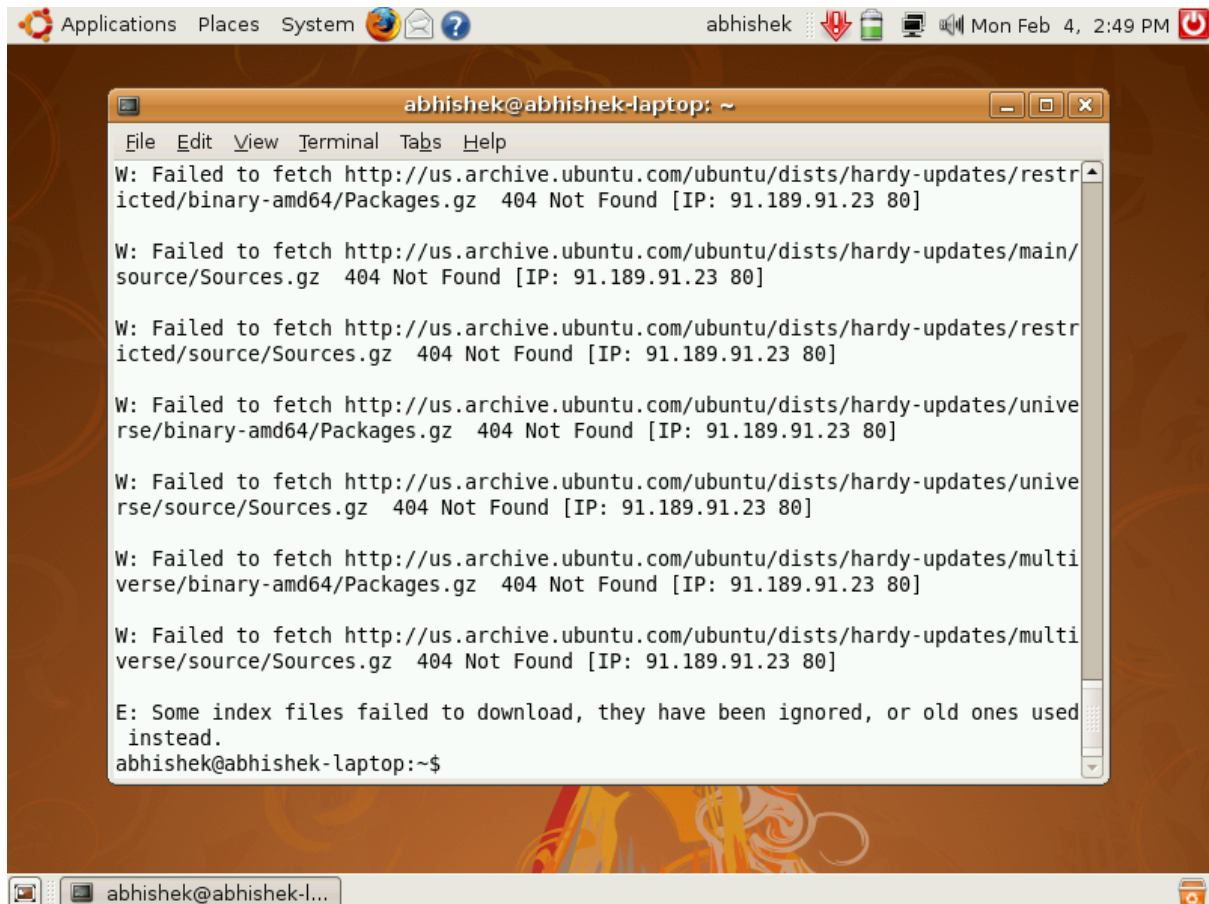

- Now we need to install the Linux source for our kernel, we also need to install the curses library and other tools to help us compile.
\$ sudo apt-get install linux-source-2.6.24 kernel-package libncurses5-dev fakeroot

We encountered an error due to the absence of packages, so we had to update the packages using the command:

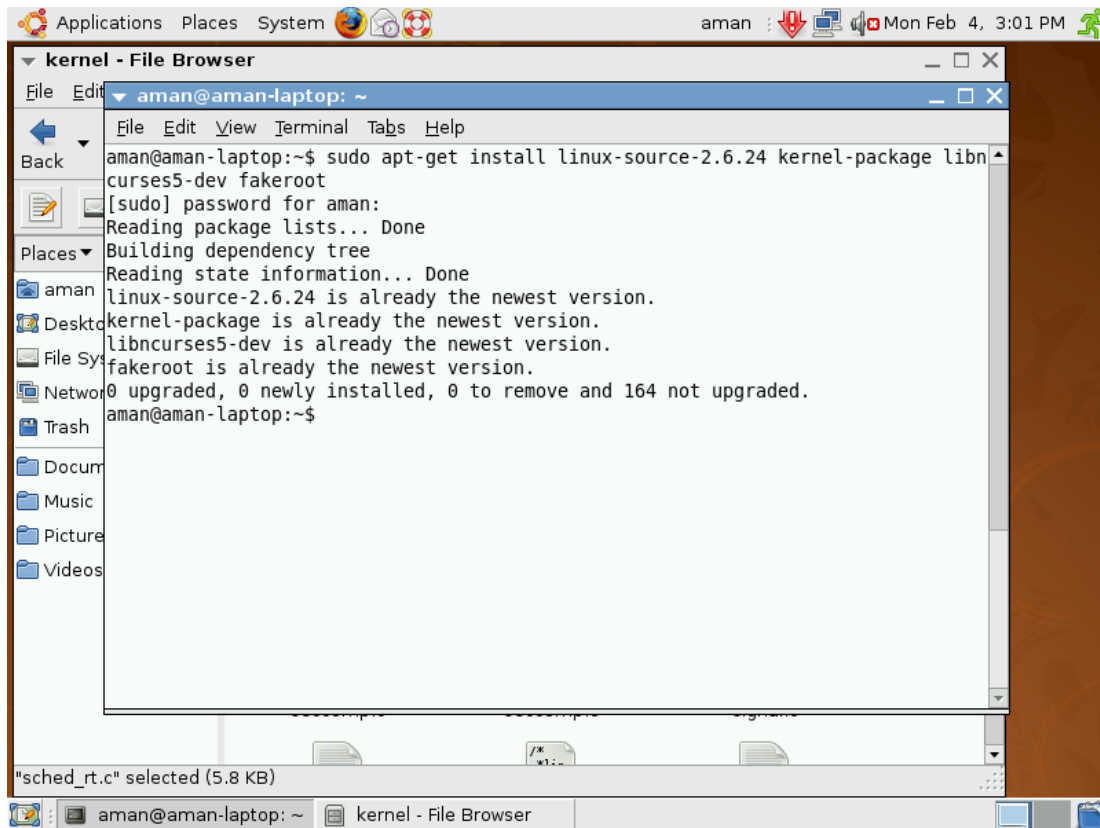

\$ sudo apt-get update

A screenshot of a Linux desktop environment. The top panel shows the Unity interface with icons for Applications, Places, and System. The user's name 'abhishek' is in the top right. A terminal window titled 'abhishek@abhishek-laptop: ~' is open, displaying the output of the 'sudo apt-get update' command. The terminal shows several 'W: Failed to fetch' messages for various Ubuntu repositories (hardy-updates, universe, multiverse) with a '404 Not Found' error. The final message is 'E: Some index files failed to download, they have been ignored, or old ones used instead.' The terminal prompt is 'abhishek@abhishek-laptop:~\$'.

- Due to the ubuntu version being too old, we were not able to use these commands as these links died. Hence, we need to update all of our deprecated urls **http://archive.ubuntu.com** to the working urls **http://old-releases.ubuntu.com** using the command:

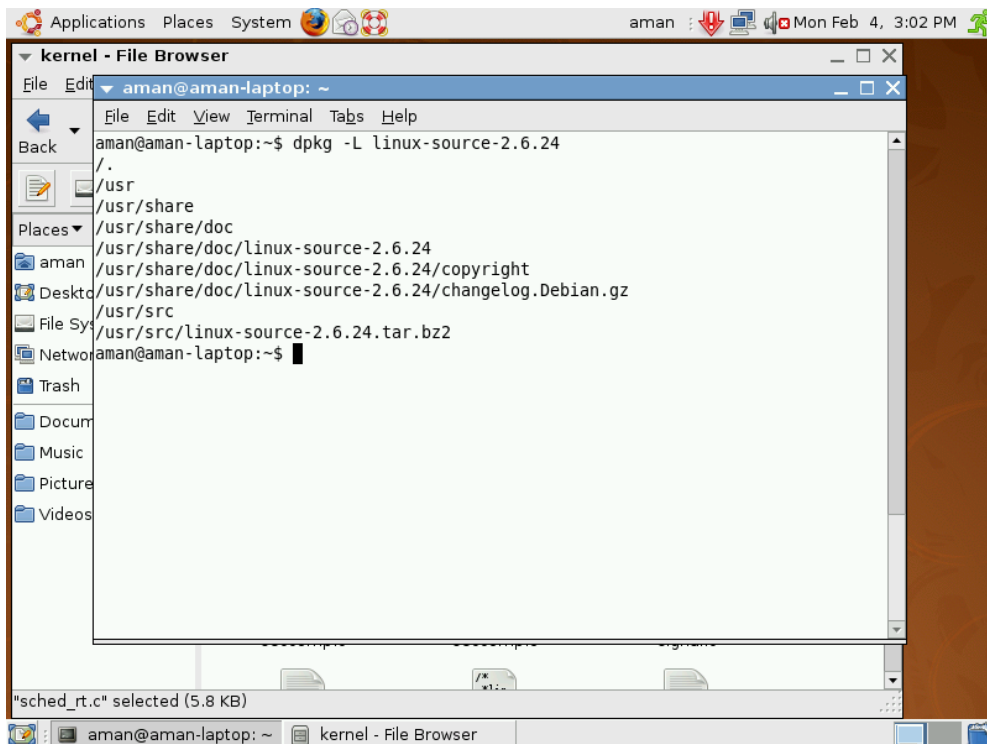

sudo sed -i -e 's/:\\/(archive.ubuntu.com\\|security.ubuntu.com)/old-releases.ubuntu.com/g' /etc/apt/sources.list

- After this the packages will be updated and you can run the previous command to install the kernel source.

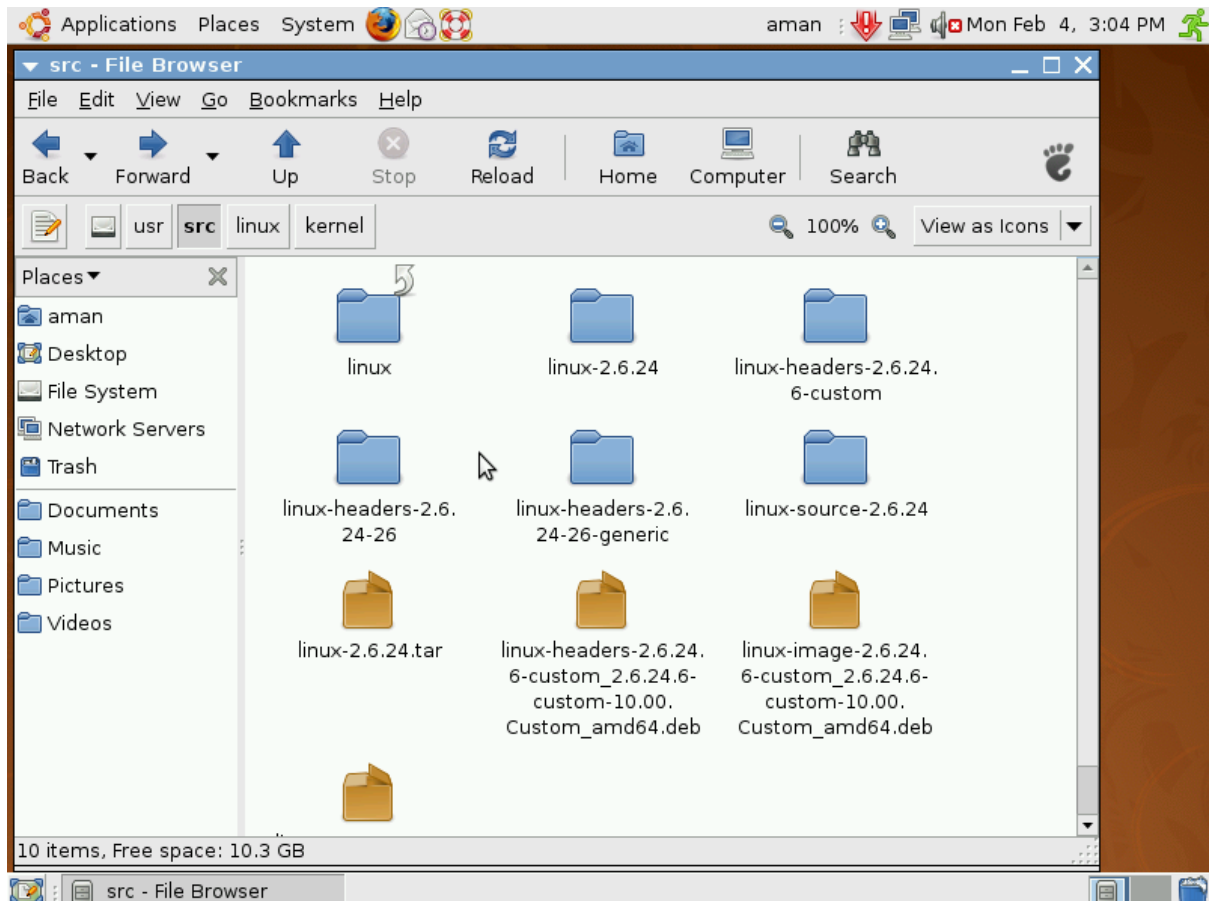

- To find out where the Linux source gets installed to, you can use the `dpkg` command to tell you the files within a package:

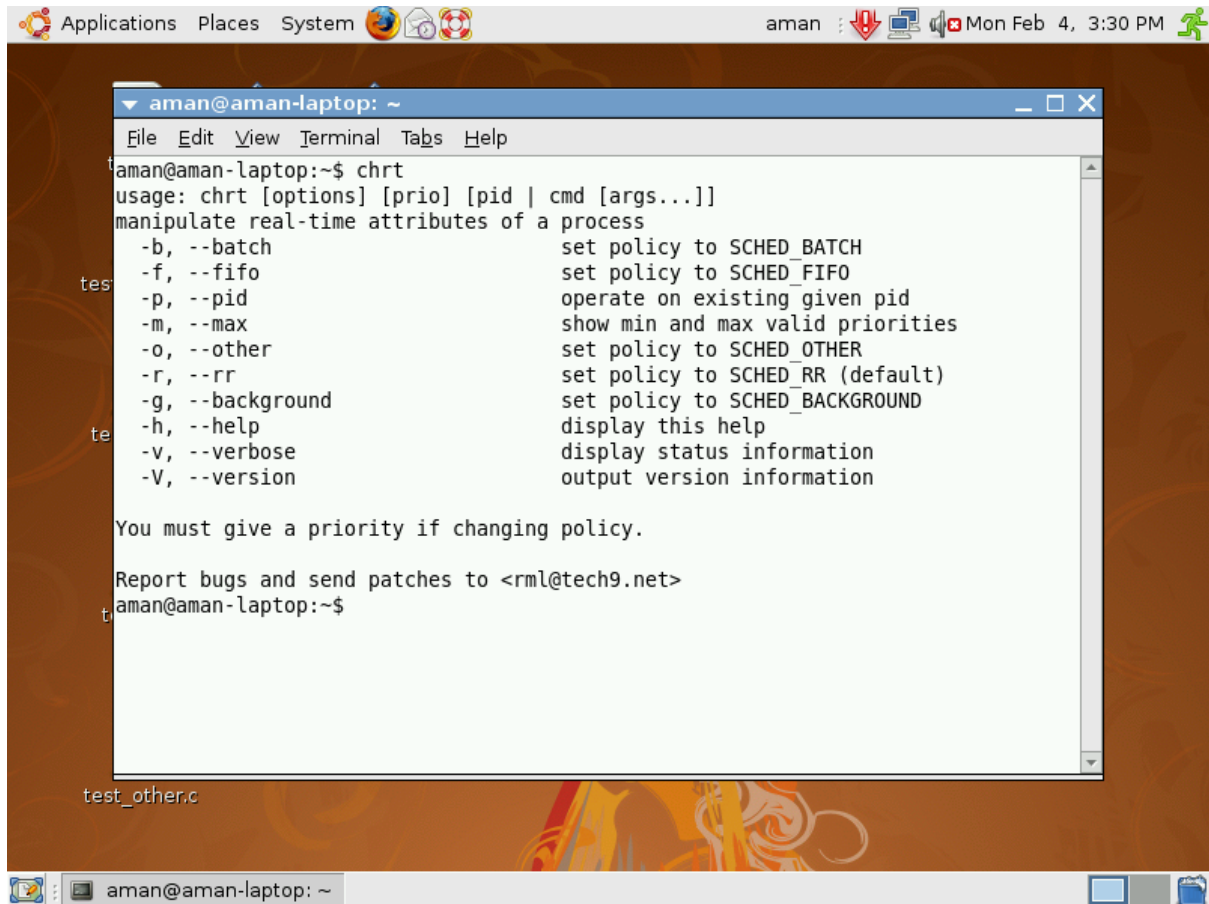

\$ dpkg -L linux-source-2.6.24

- Then we become the super-user to perform administrative tasks
\$ sudo /bin/bash
- Now we change the directory into the source location so that we can install the linux source. We then unzip the source file and save it in a folder named 'linux':
\$ cd /usr/src
\$ bunzip2 linux-source-2.6.24.tar.bz2
\$ tar xvf linux-source-2.6.24.tar
\$ ln -s linux-source-2.6.24 linux

- Then we modify the sched.c and the sched.h files to include our SCHED_BACKGROUND policy. We also modified the chrt.c file which manages our system calls for scheduling policies. We will also include our custom command to run the sched_background policy.
- To support making system calls from terminal, we also generate the object file of chrt.c and replace it with the default system file.
\$ gcc chrt.c -o chrt

The screenshot shows a Linux desktop with a terminal window titled 'aman@aman-laptop: ~'. The terminal displays the help text for the 'chrt' command. The desktop background is a brown and orange abstract pattern. The top panel shows the 'Applications', 'Places', and 'System' menus, along with system status icons and the date 'Mon Feb 4, 3:30 PM'. The bottom panel shows the 'aman@aman-laptop: ~' prompt and a taskbar with icons for a file manager, terminal, and other applications.

```
aman@aman-laptop:~$ chrt
usage: chrt [options] [prio] [pid | cmd [args...]]
manipulate real-time attributes of a process
-b, --batch          set policy to SCHED_BATCH
-f, --fifo           set policy to SCHED_FIFO
-p, --pid            operate on existing given pid
-m, --max            show min and max valid priorities
-o, --other          set policy to SCHED_OTHER
-r, --rr             set policy to SCHED_RR (default)
-g, --background    set policy to SCHED_BACKGROUND
-h, --help           display this help
-v, --verbose        display status information
-V, --version        output version information

You must give a priority if changing policy.

Report bugs and send patches to <rml@tech9.net>
aman@aman-laptop:~$
```

- So, the primarily modified files are:
 - **/include/linux/sched.h**
 - **/kernel/sched.c**
 - **/usr/bin/chrt**
- There are mainly two scheduling classes in linux-2.6.24:
 - **sched_rt.c (for real time processes)**
 - **sched_fair.c (for fair scheduling)**
- The SCHED_BACKGROUND policy needs to handle processes in its queue similar to SCHED_OTHER which follows fair scheduling so it also follows fair scheduling. Thus its operating class is sched_fair.c.
- Next, we have to make a copy of our existing kernel configuration to use for the custom compile process. We can do this by using the command:
\$ cp /boot/config- 2.6.24-generic /usr/src/linux/.config
- First, we'll do a make clean, just to make sure everything is ready for the compile
\$ make-kpkg clean
- We'll actually compile the kernel. This will take a "LONG TIME" maybe 40-50 mins.

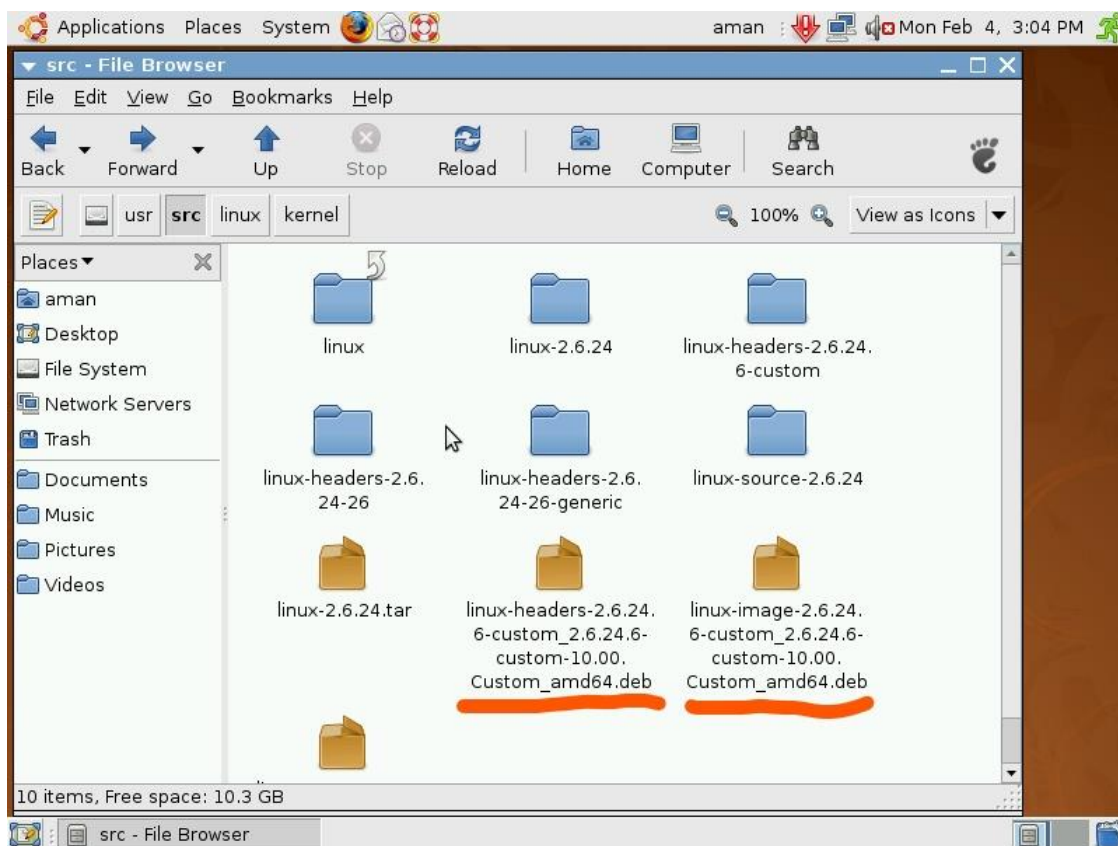

```
$ fakeroot make-kpkg --initrd --append-to-version=-custom kernel_image
```

kernel_headers

- This process will create two .deb files in /usr/src that contain the kernel
Please note that when you run these next commands, this will set the new kernel as the new default kernel. This could break things! If your machine doesn't boot, you can hit Esc at the GRUB loading menu, and select your old kernel. You can then disable the kernel in /boot/grub/menu.lst or try and compile again.

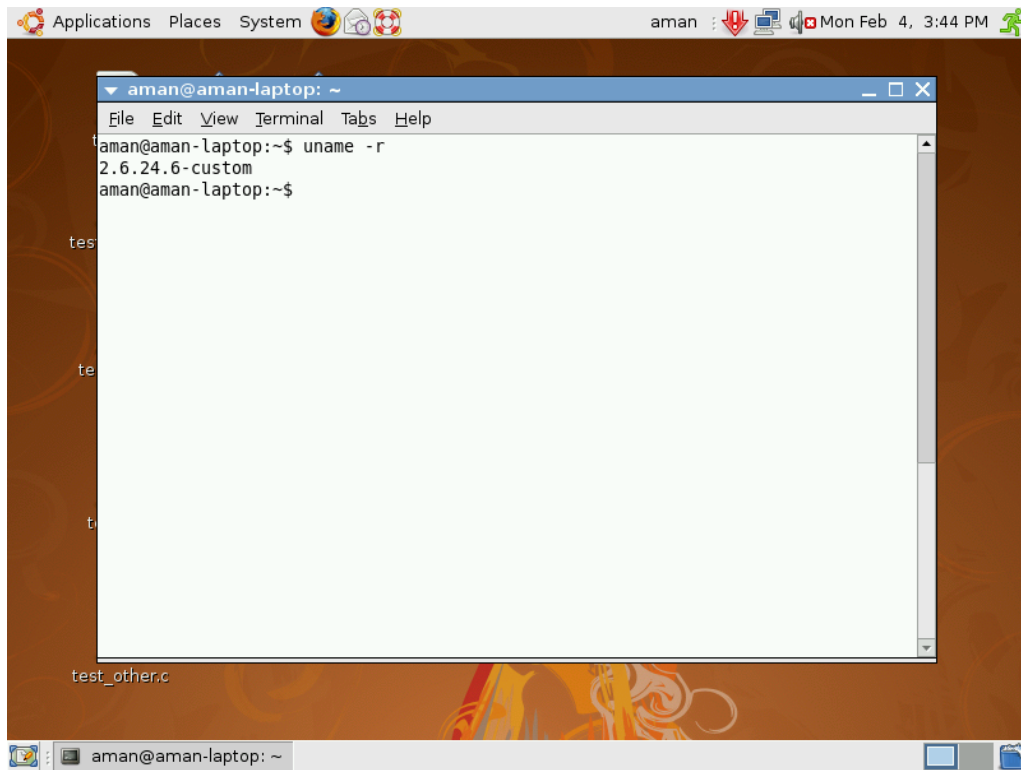

```
$ dpkg -i linux-image-2.6.24.6-custom_2.6.24.6-custom-10.00.Custom_amd64.deb
```

```
$ dpkg -i linux-headers-2.6.24.6-custom_2.6.24.6-custom-10.00.Custom_amd64.deb
```

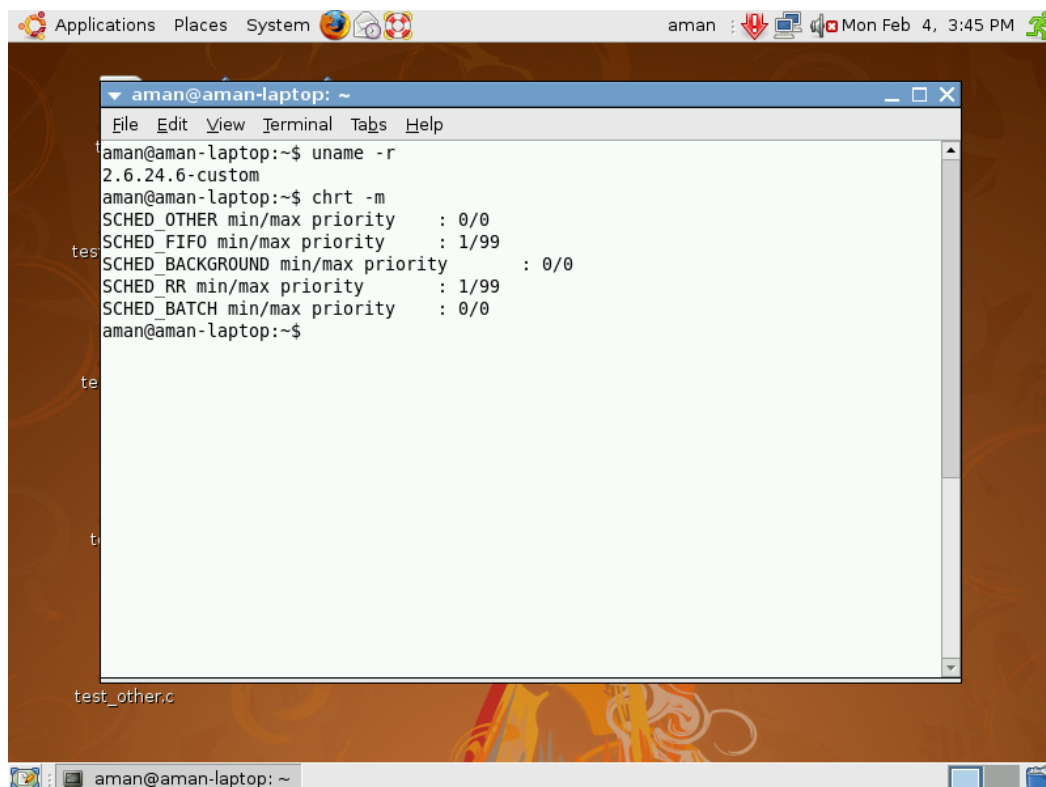

- Now we reboot our machine. After rebooting we can check whether our custom kernel version is correct or not:

```
$ uname -r
```

We can also get the priorities of the current policies using `chrt -m` command.

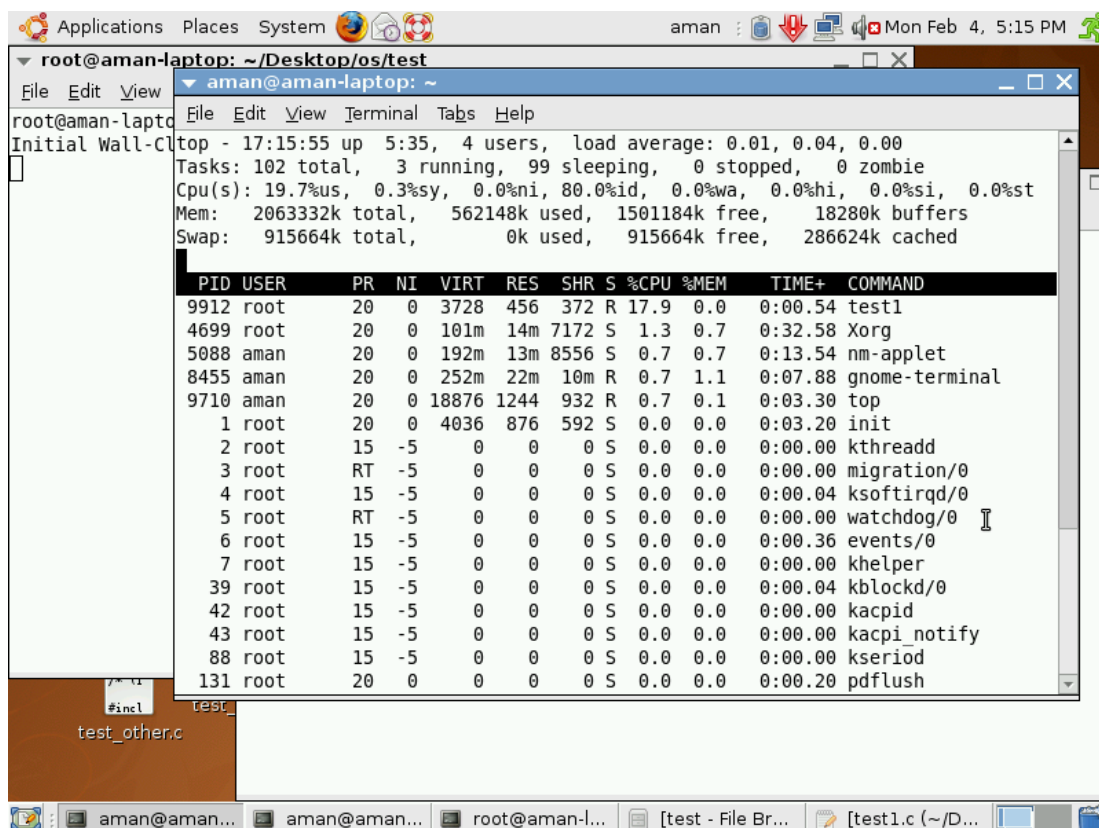

EVALUATION:

- For the evaluation purpose we have written C programs that execute z process for a counter of order of 1000000000, and finishes its execution in about 15 seconds. We used the method sched_setscheduler() to set the required policy for a process. This can also be done in shell script using chrt –[policy] -p [prio] [PID]
- We used getrusage() to get the user time and the system time for a particular process. We also use gettimeofday() to get the wall-clock time for our process. To run multiple process files simultaneously, we used shell-script.
- For evaluating a file compile the corresponding C code using command :

gcc test1.c -o test1

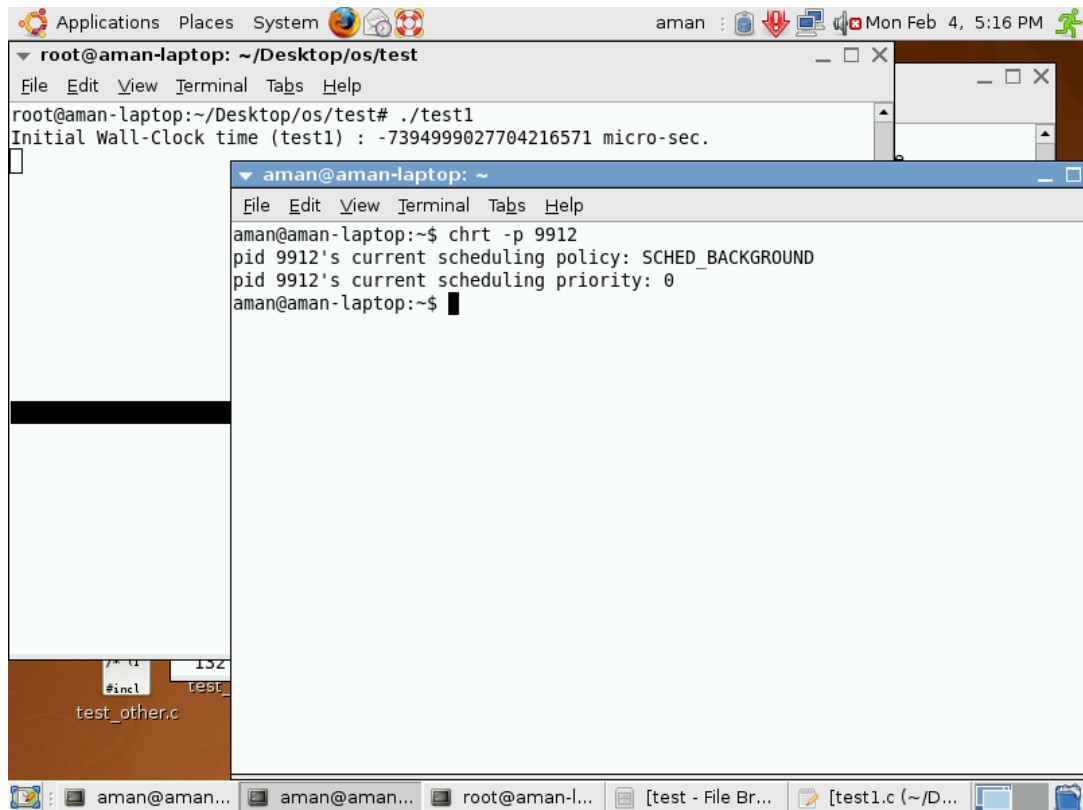

To run the C file use : **./test1**

1.) Run your counter as a SCHED_BACKGROUND. Record how long it takes to count.

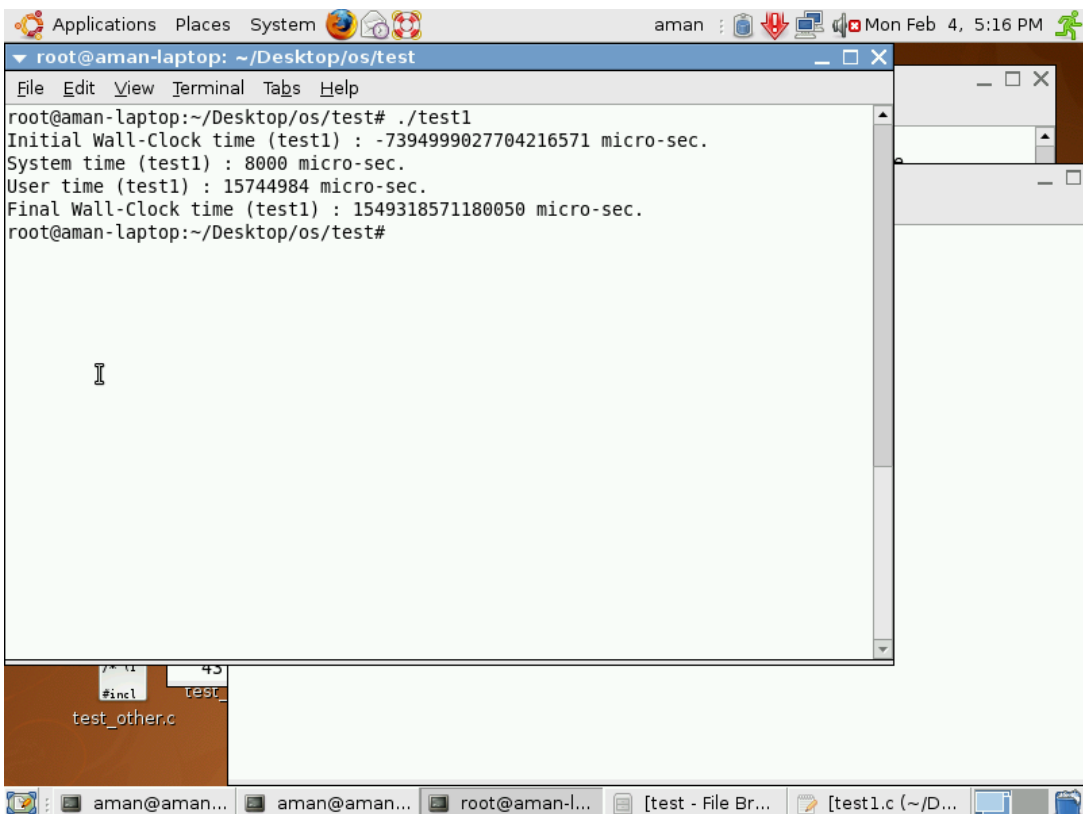

The screenshot shows a terminal window titled 'root@aman-laptop: ~/Desktop/os/test'. The terminal displays the output of the 'top' command, which provides system statistics and a list of running processes. The system statistics show 102 total tasks, 3 running, 99 sleeping, 0 stopped, and 0 zombie. The CPU usage is 19.7% user, 0.3% system, 0.0% nice, 80.0% idle, 0.0% wait, 0.0% high, 0.0% steal, and 0.0% other. The memory usage is 2063332k total, 562148k used, 1501184k free, 18280k buffers, and 915664k swap. The process list shows the following data:

PID	USER	PR	NI	VIRT	RES	SHR	S	%CPU	%MEM	TIME+	COMMAND
